Overview

While loop

Do-while loop

For loop

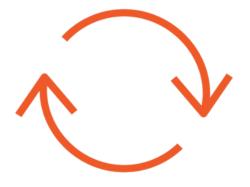

Arrays

For-each loop

Loops

Repeatedly execute a statement as long the provided condition is true

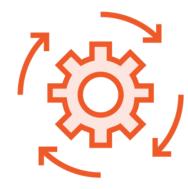

While loop

Basic looping

Do-while loop

Looping with deferred condition check

For loop

Looping with simplified notation for common use case

While Loop

Condition checked at loop start

Loop body may never run

```
while (
   statement ;
```

While Loop

```
int someValue = 4;
int factorial = 1;
while(someValue > 1)
  factorial *= someValue;
  someValue--;
System.out.println(factorial);
```

someValue

factorial

244

Do-while Loop

Condition checked at loop end

Loop body always runs at least once

```
do
   statement ;
while (
```

Do-while Loop

Main.java

```
int iVal = 5;
do
```

```
System.out.print(iVal);
System.out.print(" * 2 = ");
iVal *= 2;
System.out.println(iVal);
while(iVal < 25);</pre>
```

5

10

20

Do-while Loop

```
Main.java
int iVal = 80;
do {
  System.out.print(iVal);
  System.out.print(^{"} * 2 = ^{"});
  iVal *= 2;
  System.out.println(iVal);
} while (iVal < 25);
```

80

For Loop

Condition checked at loop start

```
for (
   statement ;
```

Loop body may never run

Simplified notation for loop control values

For Loop

```
WhileLoop.java
```

```
int i = 1;
while(          ) {
    System.out.println(i);
    i *= 2;
}
```

ForLoop.java

```
for(
    System.out.println(i);
```

```
float[] theVals
theVals[0] = 10.0f;
theVals[1] = 20.0f;
theVals[2] = 15.0f;
theVals[2] = 15.0f;
```

Provide an ordered collection of elements

- Each element accessed via an index
- Index range from 0 to number-of-elements minus 1
- Number of elements can be via array's length value

```
float[] theVals = new float[3];
theVals[0] = 10.0f;
the Vals[1] = 20.0f;
theVals[2] = 15.0f;
float sum = 0.0f;
for(
   sum += theVals[index];
System.out.println(sum);
```

```
float[] theVals = new float[3];
theVals[0] = 10.0f;
the Vals[1] = 20.0f;
the Vals[2] = 15.0f;
float sum = 0.0f;
for(int index = 0; index < theVals.length; index++)</pre>
    sum += theVals[index];
System.out.println(sum);
```

```
float[] theVals = new float[3];
the Vals[0] = 10.0f;
the Vals[1] = 20.0f;
theVals[2] = 15.0f;
float sum = 0.0f;
for(int index = 0; index < theVals.length; index++)</pre>
    sum += theVals[index];
System.out.println(sum); // displays 45
```

```
float sum = 0.0f;
for(int index = 0; index < theVals.length; index++)</pre>
    sum += theVals[index];
System.out.println(sum); // displays 45
```

float[] theVals =

For-each Loop

Executes a statement once for each array member

Handles getting collection length

Handles accessing each value

```
for (
    statement ;
```

Summary

While loop

- Checks loop control condition at start
- Loop body may never run

Do-while loop

- Checks loop control condition at end
- Loop body always runs at least once

For loop

- Similar to a while loop
- Simplified notation for loop initialization and control

Summary

Arrays

- Ordered collection of elements
- Elements accessed via index
- Index is zero-based

For-each loop

- Simplifies working with array members
- Handles details of running the loop body once for each array member
